```

1.3 Binary Exponentiation

```
1  // Binary exponentiation (a^b) mod m
2  ll binpow(ll a, ll b, ll m = MOD) {
3      a %= m;
4      ll res = 1;
5      while (b > 0) {
6          if (b & 1) res = (res * a) % m;
7          a = (a * a) % m;
8          b >>= 1;
9      }
10     return res;
11 }
```

1.2 Binary Search Template

```
1  // Binary search on answer
2  ll binarySearch(ll left, ll right, function<bool(ll)> check) {
3      ll ans = right;
4      while (left <= right) {
5          ll mid = left + (right - left) / 2;
6          if (check(mid)) {
7              ans = mid;
8              right = mid - 1;  // For minimum valid answer
9              // left = mid + 1;  // For maximum valid answer
10         } else {
11             left = mid + 1;  // For minimum valid answer
12             // right = mid - 1;  // For maximum valid answer
13         }
14     }
15     return ans;
16 }
```

2   Data Structures

2.1   DSU (Disjoint Set Union)

```cpp
// DSU with path compression and union by rank
class DSU {
private:
    vector<int> parent, rank;
public:
    DSU(int n) {
        parent.resize(n+1);
        rank.resize(n+1, 0);
        for (int i = 0; i <= n; i++) parent[i] = i;
    }

    int find(int x) {
        if (parent[x] != x) parent[x] = find(parent[x]);
        return parent[x];
    }

    void unite(int x, int y) {
        x = find(x), y = find(y);
        if (x == y) return;
        if (rank[x] < rank[y]) swap(x, y);
        parent[y] = x;
        if (rank[x] == rank[y]) rank[x]++;
    }

    bool same(int x, int y) {
        return find(x) == find(y);
    }
};
```

2.2   Segment Tree

```cpp
// Segment Tree for range queries and updates
class SegmentTree {
private:
    vector<ll> tree;
    int n;

    void build(vector<ll> &arr, int node, int start, int end) {
        if (start == end) {
            tree[node] = arr[start];
        } else {
            int mid = (start + end) / 2;
            build(arr, 2*node, start, mid);
            build(arr, 2*node+1, mid+1, end);
            tree[node] = tree[2*node] + tree[2*node+1];  // Change operation
    as needed
        }
    }
```

```cpp
    void update(int node, int start, int end, int idx, ll val) {
        if (start == end) {
            tree[node] = val;
        } else {
            int mid = (start + end) / 2;
            if (idx <= mid) update(2*node, start, mid, idx, val);
            else update(2*node+1, mid+1, end, idx, val);
            tree[node] = tree[2*node] + tree[2*node+1];
        }
    }

    ll query(int node, int start, int end, int l, int r) {
        if (r < start || l > end) return 0;  // Change identity element as
    needed
        if (l <= start && end <= r) return tree[node];
        int mid = (start + end) / 2;
        return query(2*node, start, mid, l, r) + query(2*node+1, mid+1, end, l
    , r);
    }

public:
    SegmentTree(vector<ll> &arr) {
        n = arr.size();
        tree.resize(4*n);
        build(arr, 1, 0, n-1);
    }

    void update(int idx, ll val) {
        update(1, 0, n-1, idx, val);
    }

    ll query(int l, int r) {
        return query(1, 0, n-1, l, r);
    }
};
```

2.3   Fenwick Tree (BIT)

```cpp
// Fenwick Tree (Binary Indexed Tree)
class FenwickTree {
private:
    vector<ll> tree;
    int n;

public:
    FenwickTree(int size) {
        n = size;
        tree.resize(n+1, 0);
    }

    void update(int idx, ll delta) {
        for (; idx <= n; idx += idx & -idx) {
            tree[idx] += delta;
        }
```

```
17        }
18
19    ll query(int idx) {
20        ll sum = 0;
21        for (; idx > 0; idx -= idx & -idx) {
22            sum += tree[idx];
23        }
24        return sum;
25    }
26
27    ll rangeQuery(int l, int r) {
28        return query(r) - query(l-1);
29    }
30 };
```

2.4   Trie

```
1  // Trie (Prefix Tree)
2  class Trie {
3  private:
4      struct Node {
5          vector<Node*> children;
6          bool isEnd;
7          Node() : children(26, nullptr), isEnd(false) {}
8      };
9      Node* root;
10
11 public:
12     Trie() { root = new Node(); }
13
14     void insert(string word) {
15         Node* curr = root;
16         for (char c : word) {
17             int idx = c - 'a';
18             if (!curr->children[idx]) {
19                 curr->children[idx] = new Node();
20             }
21             curr = curr->children[idx];
22         }
23         curr->isEnd = true;
24     }
25
26     bool search(string word) {
27         Node* curr = root;
28         for (char c : word) {
29             int idx = c - 'a';
30             if (!curr->children[idx]) return false;
31             curr = curr->children[idx];
32         }
33         return curr->isEnd;
34     }
35
36     bool startsWith(string prefix) {
37         Node* curr = root;
```

```
38         for (char c : prefix) {
39             int idx = c - 'a';
40             if (!curr->children[idx]) return false;
41             curr = curr->children[idx];
42         }
43         return true;
44     }
45 };
```

2.5   Sparse Table

```
1  // Sparse Table for RMQ (Range Minimum Query)
2  class SparseTable {
3  private:
4      vector<vector<ll>> table;
5      vector<int> log;
6
7  public:
8      SparseTable(vector<ll> &arr) {
9          int n = arr.size();
10         int maxLog = log2(n) + 1;
11         table.assign(n, vector<ll>(maxLog));
12         log.resize(n+1);
13
14         for (int i = 0; i < n; i++) table[i][0] = arr[i];
15
16         for (int j = 1; j < maxLog; j++) {
17             for (int i = 0; i + (1 << j) <= n; i++) {
18                 table[i][j] = min(table[i][j-1], table[i + (1 << (j-1))][j-1])
   ;
19             }
20         }
21
22         for (int i = 2; i <= n; i++) log[i] = log[i/2] + 1;
23     }
24
25     ll query(int l, int r) {
26         int j = log[r - l + 1];
27         return min(table[l][j], table[r - (1 << j) + 1][j]);
28     }
29 };
```

2.6   Ordered Set (PBDS)

```
1  #include <ext/pb_ds/tree_policy.hpp>
2  #include <ext/pb_ds/assoc_container.hpp>
3  using namespace __gnu_pbds;
4
5  template<typename T> using ordered_set = tree<T, null_type, less<T>,
       rb_tree_tag, tree_order_statistics_node_update>;
6
7  // Usage:
8  ordered_set<int> os;
```

```
9   os.insert(5);
10  os.insert(2);
11  os.insert(7);
12  os.order_of_key(5);   // Returns number of elements < 5
13  *os.find_by_order(1);   // Returns element at index 1
```

3   Graph Algorithms

3.1   Graph Representation

```cpp
// Graph representation - Adjacency list
vector<vector<int>> adj(N);  // Unweighted
vector<vector<pair<int, int>>> adjWeighted(N);  // Weighted: {node, weight}

// For directed graph, add edge once
// For undirected graph, add edge twice
void addEdge(int u, int v) {
    adj[u].pb(v);
    // adj[v].pb(u);  // Uncomment for undirected
}

void addWeightedEdge(int u, int v, int w) {
    adjWeighted[u].pb({v, w});
    // adjWeighted[v].pb({u, w});  // Uncomment for undirected
}
```

3.2   DFS (Depth First Search)

```cpp
// DFS - Depth First Search
vector<bool> visited(N, false);

void dfs(int u) {
    visited[u] = true;
    for (int v : adj[u]) {
        if (!visited[v]) {
            dfs(v);
        }
    }
}

// DFS with parent tracking
void dfs(int u, int parent) {
    for (int v : adj[u]) {
        if (v != parent) {
            dfs(v, u);
        }
    }
}
```

3.3   BFS (Breadth First Search)

```cpp
// BFS - Breadth First Search
vector<bool> visited(N, false);
vector<int> dist(N, -1);

void bfs(int start) {
    queue<int> q;
    q.push(start);
```

```
8        visited[start] = true;
9        dist[start] = 0;
10
11       while (!q.empty()) {
12           int u = q.front();
13           q.pop();
14
15           for (int v : adj[u]) {
16               if (!visited[v]) {
17                   visited[v] = true;
18                   dist[v] = dist[u] + 1;
19                   q.push(v);
20               }
21           }
22       }
23   }
```

3.4 Dijkstra's Algorithm

```
1  // Dijkstra's Algorithm - Single source shortest path
2  vector<ll> dijkstra(int start, int n) {
3      vector<ll> dist(n+1, LINF);
4      dist[start] = 0;
5      priority_queue<pair<ll, int>, vector<pair<ll, int>>, greater<pair<ll, int>>> pq;
6      pq.push({0, start});
7
8      while (!pq.empty()) {
9          ll d = pq.top().F;
10         int u = pq.top().S;
11         pq.pop();
12
13         if (d > dist[u]) continue;
14
15         for (auto [v, w] : adjWeighted[u]) {
16             if (dist[u] + w < dist[v]) {
17                 dist[v] = dist[u] + w;
18                 pq.push({dist[v], v});
19             }
20         }
21     }
22     return dist;
23 }
```

3.5 Floyd-Warshall

```
1  // Floyd-Warshall - All pairs shortest path
2  vector<vector<ll>> floydWarshall(int n) {
3      vector<vector<ll>> dist(n+1, vector<ll>(n+1, LINF));
4
5      // Initialize distances
6      for (int i = 1; i <= n; i++) dist[i][i] = 0;
7      for (int u = 1; u <= n; u++) {
```

```
8          for (auto [v, w] : adjWeighted[u]) {
9              dist[u][v] = min(dist[u][v], (ll)w);
10         }
11     }
12
13     // Floyd-Warshall algorithm
14     for (int k = 1; k <= n; k++) {
15         for (int i = 1; i <= n; i++) {
16             for (int j = 1; j <= n; j++) {
17                 if (dist[i][k] != LINF && dist[k][j] != LINF) {
18                     dist[i][j] = min(dist[i][j], dist[i][k] + dist[k][j]);
19                 }
20             }
21         }
22     }
23     return dist;
24 }
```

3.6 Topological Sort

```
1  // Topological Sort using DFS
2  vector<bool> visited(N, false);
3  vector<int> topoOrder;
4
5  void dfsTopo(int u) {
6      visited[u] = true;
7      for (int v : adj[u]) {
8          if (!visited[v]) {
9              dfsTopo(v);
10         }
11     }
12     topoOrder.pb(u);
13 }
14
15 vector<int> topologicalSort(int n) {
16     topoOrder.clear();
17     fill(all(visited), false);
18     for (int i = 1; i <= n; i++) {
19         if (!visited[i]) dfsTopo(i);
20     }
21     reverse(all(topoOrder));
22     return topoOrder;
23 }
```

3.7 Cycle Detection

```
1  // Cycle detection in directed graph
2  vector<int> color(N, 0);  // 0: white, 1: gray, 2: black
3
4  bool hasCycle(int u) {
5      color[u] = 1;  // Gray
6      for (int v : adj[u]) {
7          if (color[v] == 1) return true;  // Back edge found
```

```
 8        if (color[v] == 0 && hasCycle(v)) return true;
 9    }
10    color[u] = 2;   // Black
11    return false;
12 }
13
14 // Cycle detection in undirected graph
15 bool hasCycleUndirected(int u, int parent) {
16    visited[u] = true;
17    for (int v : adj[u]) {
18        if (!visited[v]) {
19            if (hasCycleUndirected(v, u)) return true;
20        } else if (v != parent) {
21            return true;
22        }
23    }
24    return false;
25 }
```

```
34
35    // Second DFS on reverse graph
36    fill(all(visited), false);
37    vector<vector<int>> scc;
38    reverse(all(order));
39    for (int u : order) {
40        if (!visited[u]) {
41            component.clear();
42            dfs2(u, adjRev);
43            scc.pb(component);
44        }
45    }
46    return scc;
47 }
```

3.8   Strongly Connected Components (Kosaraju)

```
 1 // Kosaraju's algorithm for Strongly Connected Components
 2 vector<bool> visited(N, false);
 3 vector<int> order, component;
 4
 5 void dfs1(int u) {
 6    visited[u] = true;
 7    for (int v : adj[u]) {
 8        if (!visited[v]) dfs1(v);
 9    }
10    order.pb(u);
11 }
12
13 void dfs2(int u, vector<vector<int>> &adjRev) {
14    visited[u] = true;
15    component.pb(u);
16    for (int v : adjRev[u]) {
17        if (!visited[v]) dfs2(v, adjRev);
18    }
19 }
20
21 vector<vector<int>> findSCC(int n) {
22    // Build reverse graph
23    vector<vector<int>> adjRev(n+1);
24    for (int u = 1; u <= n; u++) {
25        for (int v : adj[u]) adjRev[v].pb(u);
26    }
27
28    // First DFS
29    fill(all(visited), false);
30    order.clear();
31    for (int i = 1; i <= n; i++) {
32        if (!visited[i]) dfs1(i);
33    }
```

4   String Algorithms

4.1   KMP Algorithm

```cpp
// KMP Algorithm for pattern matching
vector<int> buildLPS(string pattern) {
    int m = pattern.length();
    vector<int> lps(m, 0);
    int len = 0, i = 1;

    while (i < m) {
        if (pattern[i] == pattern[len]) {
            len++;
            lps[i] = len;
            i++;
        } else {
            if (len != 0) len = lps[len-1];
            else { lps[i] = 0; i++; }
        }
    }
    return lps;
}

vector<int> kmpSearch(string text, string pattern) {
    vector<int> lps = buildLPS(pattern);
    vector<int> matches;
    int n = text.length(), m = pattern.length();
    int i = 0, j = 0;

    while (i < n) {
        if (text[i] == pattern[j]) { i++; j++; }
        if (j == m) {
            matches.pb(i - j);
            j = lps[j-1];
        } else if (i < n && text[i] != pattern[j]) {
            if (j != 0) j = lps[j-1];
            else i++;
        }
    }
    return matches;
}
```

4.2   Z-Algorithm

```cpp
// Z-Algorithm for string preprocessing
vector<int> buildZ(string s) {
    int n = s.length();
    vector<int> z(n, 0);
    int l = 0, r = 0;

    for (int i = 1; i < n; i++) {
        if (i <= r) z[i] = min(r - i + 1, z[i - l]);
        while (i + z[i] < n && s[z[i]] == s[i + z[i]]) z[i]++;
```

```cpp
        if (i + z[i] - 1 > r) {
            l = i;
            r = i + z[i] - 1;
        }
    }
    return z;
}

// Find all occurrences of pattern in text
vector<int> zSearch(string text, string pattern) {
    string combined = pattern + "$" + text;
    vector<int> z = buildZ(combined);
    vector<int> matches;
    int m = pattern.length();
    for (int i = m + 1; i < combined.length(); i++) {
        if (z[i] == m) matches.pb(i - m - 1);
    }
    return matches;
}
```

4.3   String Utilities

```cpp
// String reverse
string reverseStr(string s) {
    reverse(all(s));
    return s;
}

// Check if string is palindrome
bool isPalindrome(string s) {
    int n = s.length();
    for (int i = 0; i < n/2; i++) {
        if (s[i] != s[n-1-i]) return false;
    }
    return true;
}

// Convert string to lowercase
string toLower(string s) {
    transform(all(s), s.begin(), ::tolower);
    return s;
}

// Convert string to uppercase
string toUpper(string s) {
    transform(all(s), s.begin(), ::toupper);
    return s;
}

// Split string by delimiter
vector<string> split(const string &str, const string &delimiter) {
    vector<string> tokens;
    size_t start = 0, end, delimLength = delimiter.length();
```

```
33      while ((end = str.find(delimiter, start)) != string::npos) {
34          tokens.push_back(str.substr(start, end - start));
35          start = end + delimLength;
36      }
37      tokens.push_back(str.substr(start));
38      return tokens;
39 }
```

5 Mathematical Algorithms

5.1 GCD and LCM

```
1 // Recursive GCD
2 ll gcd(ll a, ll b) {
3     return b == 0 ? a : gcd(b, a % b);
4 }
5
6 // Efficient and overflow-safe LCM function
7 ll lcm(ll a, ll b) {
8     return (a / __gcd(a, b)) * b;
9 }
```

5.2 Extended Euclidean Algorithm

```
1 // Extended Euclidean Algorithm - returns gcd and coefficients
2 ll extgcd(ll a, ll b, ll &x, ll &y) {
3     if (b == 0) {
4         x = 1, y = 0;
5         return a;
6     }
7     ll x1, y1;
8     ll g = extgcd(b, a % b, x1, y1);
9     x = y1;
10     y = x1 - (a / b) * y1;
11     return g;
12 }
13
14 // Modular inverse using extended Euclidean
15 ll modInverse(ll a, ll m = MOD) {
16     ll x, y;
17     ll g = extgcd(a, m, x, y);
18     if (g != 1) return -1;   // No inverse exists
19     return (x % m + m) % m;
20 }
```

5.3 Modular Arithmetic

```
1 // Modular arithmetic operations
2 ll modAdd(ll a, ll b, ll m = MOD) { return ((a % m) + (b % m)) % m; }
3 ll modSub(ll a, ll b, ll m = MOD) { return ((a % m) - (b % m) + m) % m; }
4 ll modMul(ll a, ll b, ll m = MOD) { return ((a % m) * (b % m)) % m; }
5 ll modDiv(ll a, ll b, ll m = MOD) { return modMul(a, modInverse(b, m), m); }
```

5.4 Sieve of Eratosthenes

```
1 // Sieve of Eratosthenes - Generate primes up to n
2 vector<bool> isPrime(N, true);
3 vector<int> primes;
4
```

```
5  void sieve(int n) {
6      isPrime[0] = isPrime[1] = false;
7      for (int i = 2; i * i <= n; i++) {
8          if (isPrime[i]) {
9              for (int j = i * i; j <= n; j += i) {
10                 isPrime[j] = false;
11             }
12         }
13     }
14     for (int i = 2; i <= n; i++) {
15         if (isPrime[i]) primes.pb(i);
16     }
17 }
```

5.5 Prime Factorization

```
1  // Prime factorization
2  vector<pair<ll, int>> factorize(ll n) {
3      vector<pair<ll, int>> factors;
4      for (ll i = 2; i * i <= n; i++) {
5          if (n % i == 0) {
6              int cnt = 0;
7              while (n % i == 0) {
8                  n /= i;
9                  cnt++;
10             }
11             factors.pb({i, cnt});
12         }
13     }
14     if (n > 1) factors.pb({n, 1});
15     return factors;
16 }
```

5.6 Euler Totient Function

```
1  // Euler Totient Function using sieve
2  vector<int> phi(N);
3
4  void eulerTotient(int n) {
5      for (int i = 1; i <= n; i++) phi[i] = i;
6      for (int i = 2; i <= n; i++) {
7          if (phi[i] == i) {  // i is prime
8              for (int j = i; j <= n; j += i) {
9                  phi[j] -= phi[j] / i;
10             }
11         }
12     }
13 }
```

5.7 Combinatorics

```
1  // Factorial with mod
2  vector<ll> fact(N);
3
4  void precomputeFactorial(int n, ll m = MOD) {
5      fact[0] = 1;
6      for (int i = 1; i <= n; i++) {
7          fact[i] = (fact[i-1] * i) % m;
8      }
9  }
10
11 // nCr with mod
12 ll nCr(ll n, ll r, ll m = MOD) {
13     if (r > n || r < 0) return 0;
14     ll num = fact[n];
15     ll den = (fact[r] * fact[n-r]) % m;
16     return (num * modInverse(den, m)) % m;
17 }
```

5.8 Matrix Exponentiation

```
1  // Matrix multiplication
2  vector<vector<ll>> matMul(vector<vector<ll>> &a, vector<vector<ll>> &b, ll m =
       MOD) {
3      int n = a.size();
4      vector<vector<ll>> res(n, vector<ll>(n, 0));
5      for (int i = 0; i < n; i++) {
6          for (int j = 0; j < n; j++) {
7              for (int k = 0; k < n; k++) {
8                  res[i][j] = (res[i][j] + (a[i][k] * b[k][j]) % m) % m;
9              }
10         }
11     }
12     return res;
13 }
14
15 // Matrix exponentiation
16 vector<vector<ll>> matPow(vector<vector<ll>> base, ll exp, ll m = MOD) {
17     int n = base.size();
18     vector<vector<ll>> res(n, vector<ll>(n, 0));
19     for (int i = 0; i < n; i++) res[i][i] = 1;  // Identity matrix
20
21     while (exp > 0) {
22         if (exp & 1) res = matMul(res, base, m);
23         base = matMul(base, base, m);
24         exp >>= 1;
25     }
26     return res;
27 }
```

6   STL Containers and Utilities

6.1   Vector

```
vector<int> v;
v.push_back(5);            // Add element
v.pop_back();              // Remove last element
v.size();                  // Get size
v.empty();                 // Check if empty
v.clear();                 // Clear all elements
sort(v.begin(), v.end());  // Sort
reverse(v.begin(), v.end()); // Reverse
v.resize(n, val);          // Resize with default value
v.insert(v.begin() + i, val); // Insert at position
v.erase(v.begin() + i);    // Erase at position
auto it = find(v.begin(), v.end(), val); // Find element
```

6.2   Map and Unordered Map

```
map<string, int> mp;
mp["key"] = value;         // Insert/update
mp.count("key");           // Check existence (0 or 1)
mp.find("key");            // Returns iterator
mp.erase("key");           // Erase by key
mp.size();                 // Number of elements
for (auto [key, val] : mp) { } // Iterate

unordered_map<string, int> ump; // Faster, no ordering
```

6.3   Set and Unordered Set

```
set<int> s;
s.insert(5);               // Insert
s.erase(5);                // Erase
s.count(5);                // Check existence
s.find(5);                 // Returns iterator
s.lower_bound(5);          // First element >= 5
s.upper_bound(5);          // First element > 5
s.size();

multiset<int> ms;          // Allows duplicates
ms.erase(ms.find(5));      // Erase one occurrence
ms.erase(5);               // Erase all occurrences

unordered_set<int> us;     // Faster, no ordering
```

6.4   Priority Queue

```
// Max heap (default)
priority_queue<int> pq;
pq.push(5);
```

```
pq.top();                  // Get max element
pq.pop();                  // Remove max element
pq.size();
pq.empty();

// Min heap
priority_queue<int, vector<int>, greater<int>> minpq;

// Custom comparator
auto cmp = [](int a, int b) { return a > b; };
priority_queue<int, vector<int>, decltype(cmp)> custompq(cmp);
```

6.5   Queue and Deque

```
queue<int> q;
q.push(5);                 // Add to back
q.pop();                   // Remove from front
q.front();                 // Get front element
q.back();                  // Get back element
q.size();
q.empty();

deque<int> dq;
dq.push_front(5);          // Add to front
dq.push_back(5);           // Add to back
dq.pop_front();            // Remove from front
dq.pop_back();             // Remove from back
dq.front();
dq.back();
```

6.6   Stack

```
stack<int> st;
st.push(5);                // Add to top
st.pop();                  // Remove from top
st.top();                  // Get top element
st.size();
st.empty();
```

6.7   Pair

```
pair<int, int> p = {1, 2};
p.first;                   // Access first element
p.second;                  // Access second element
p = make_pair(3, 4);

// Vector of pairs
vector<pair<int, int>> vp;
vp.push_back({1, 2});
sort(vp.begin(), vp.end()); // Sorts by first, then second
```

6.8   Common STL Algorithms

```cpp
// Sorting
sort(v.begin(), v.end());                          // Ascending
sort(v.begin(), v.end(), greater<int>());      // Descending
sort(v.begin(), v.end(), [](int a, int b) { return a > b; }); // Custom

// Binary search (requires sorted container)
binary_search(v.begin(), v.end(), val);        // Returns bool
lower_bound(v.begin(), v.end(), val);          // First >= val
upper_bound(v.begin(), v.end(), val);          // First > val

// Other useful functions
max(a, b); min(a, b);
max_element(v.begin(), v.end());               // Returns iterator
min_element(v.begin(), v.end());
accumulate(v.begin(), v.end(), 0LL);           // Sum
count(v.begin(), v.end(), val);                // Count occurrences
find(v.begin(), v.end(), val);                 // Find element
reverse(v.begin(), v.end());                   // Reverse
unique(v.begin(), v.end());                    // Remove consecutive duplicates
next_permutation(v.begin(), v.end());          // Next permutation
prev_permutation(v.begin(), v.end());          // Previous permutation
```

7   Miscellaneous Utilities

7.1   Grid Helpers

```cpp
// 4-direction movement
int dx4[] = {-1, 0, +1, 0};
int dy4[] = {0, -1, 0, +1};

// 8-direction movement (including diagonals)
int dx8[] = {-1, -1, -1, 0, 0, +1, +1, +1};
int dy8[] = {-1, 0, +1, -1, +1, -1, 0, +1};

// Boundary check
inline bool in(int i, int j) {
    return (0 <= i && i < n && 0 <= j && j < m);
}

// Grid traversal helper
void traverseGrid(int i, int j) {
    for (int k = 0; k < 4; k++) {   // Change to 8 for diagonal
        int ni = i + dx4[k];
        int nj = j + dy4[k];
        if (in(ni, nj)) {
            // Process cell (ni, nj)
        }
    }
}
```

7.2   Coordinate Compression

```cpp
// Coordinate compression
vector<int> compress(vector<int> &arr) {
    vector<int> sorted = arr;
    sort(all(sorted));
    sorted.erase(unique(all(sorted)), sorted.end());

    vector<int> compressed;
    for (int x : arr) {
        int idx = lower_bound(all(sorted), x) - sorted.begin();
        compressed.pb(idx);
    }
    return compressed;
}
```

7.3   Timing Utilities

```cpp
#include <chrono>
using namespace std::chrono;

auto start_time = high_resolution_clock::now();
// Your code here
auto end_time = high_resolution_clock::now();
```

```
7  auto duration = duration_cast<microseconds>(end_time - start_time);
8  cout << "Time: " << duration.count() << " microseconds" << endl;
```

7.4   Merge Sort with Inversion Count

```
1  ll inversionCount = 0;
2
3  void merge(vector<int>& arr, int low, int mid, int high) {
4      vector<int> temp(high - low + 1);
5      int i = low, j = mid + 1, k = 0;
6      while (i <= mid && j <= high) {
7          if (arr[i] <= arr[j]) temp[k++] = arr[i++];
8          else {
9              temp[k++] = arr[j++];
10             inversionCount += (mid - i + 1);  // Count inversions
11         }
12     }
13     while (i <= mid) temp[k++] = arr[i++];
14     while (j <= high) temp[k++] = arr[j++];
15     for (int idx = 0; idx < temp.size(); idx++) {
16         arr[low + idx] = temp[idx];
17     }
18 }
19
20 void mergeSort(vector<int>& arr, int low, int high) {
21     if (low < high) {
22         int mid = low + (high - low) / 2;
23         mergeSort(arr, low, mid);
24         mergeSort(arr, mid + 1, high);
25         merge(arr, low, mid, high);
26     }
27 }
```

7.5   Useful Constants and Macros

```
1  const double PI = acos(-1);
2  const int INF = 1e9 + 7;
3  const ll LINF = 1e18 + 7;
4  const int MOD = 1e9 + 7;
5  const int N = 1e5 + 5;
6
7  // Common macros already in boilerplate:
8  // sp, nl, F, S, ll, pb, popb, gcd, lcm, all, SUM, etc.
```
